**3** Gaussian kernel Ball-Carving LSH very slow  $e^{\tilde{O}(\log^{\frac{2}{3}}(n))}$ 

#### Theorem [Charikar, S. FOCS'17]

For certain kernels HBE solves the kernel evaluation problem for  $\mu \geq \tau$  using  $O(1/\sqrt{\mu}\epsilon^2)$  samples and  $O(n/\sqrt{\tau}\epsilon^2)$  space.

#### **Practical Limitations:**

- **1** Super-linear Space  $\Rightarrow$  Not practical for massive datasets
- 2 Uses Adaptive procedure to estim. number of samples:
   ⇒ large-constant + stringent requirements on hash functions.
- **3** Gaussian kernel Ball-Carving LSH very slow  $e^{\tilde{O}(\log^{\frac{2}{3}}(n))}$

**Q:** Practical HBE + preserve theoretical guarantees?

# [Charikar, S. FOCS'17]

# **Practical Limitations:**

- super-linear space!
- 2 Adaptive procedure has large constant overhead.
- Gaussian Kernel
   Ball-Carving LSH is slow.

# [This work ICML'19]

# **Resolve by:**

- **1** Sketching (sub-linear space)
- Improved Adaptive procedure + New Analysis
- Practical HBE for Gaussian Kernel via Eulcidean LSH

# [Charikar, S. FOCS'17]

# Practical Limitations:

- 1 super-linear space!
- 2 Adaptive procedure has large constant overhead.
- Gaussian Kernel
   Ball-Carving LSH is slow.

# [This work ICML'19]

# Resolve by:

- **1** Sketching (sub-linear space)

Unbiased estimators: Random Sampling, HBE

Metric of interest is average relative variance:

$$\mathbb{E}_{q \sim P}\left[\frac{\mathbb{V}[Z(q)]}{\mathbb{E}[Z(q)]^2}\right] \propto \text{"Sample Complexity"}$$

### **Diagnostic Procedure**

- **1** Sample a number T of random queries from P.
- **2** For each  $\Rightarrow$  **upper bound** Relative Variance
- 3 Average for each method of interest over T queries.

## Evaluation

Intro Contribution Sketching Diagnostics Evaluation Conclusion of Algorithms for Kernel Evaluation

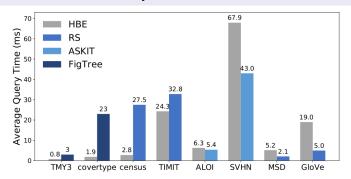

- Random Sampling (RS): sensitive to range of kernel values (distances).
- Hashing-Based-Estimators (HBE): sensitive to "correlations" (dense distant clusters) [Charikar, S. FOCS'2017][This work ICML'2019]
- Fast Improved Gauss Transform (FIGTree): sensitive to # "clusters" (directions) at certain distance [Morariu,Srinivasan,Raykar, Duraiswami, Davis, NeurIPS'2009]
- Approximate Skeletonization via Treecodes (ASKIT) sensitive to "medium" distance scale/size clusters [March, Xiao, Biros, SIAM JSC 2015]
