

# Augment with Care: Contrastive Learning for Combinatorial Problems

*Haonan Duan\*, Pashootan Vaezipoor\*, Max B. Paulus, Yangjun Ruan, Chris J. Maddison*

# Supervised learning for combinatorial problems

	Input	Label	ML model (e.g.,)
<b>Boolean satisfiability (SAT)</b>	$(x_1 \vee x_2 \vee \neg x_3) \\ \wedge (\neg x_1 \vee x_2 \vee x_3)$	SAT/UNSAT	NeuroSAT (Selsam et al, 2019)
<b>Mixed Integer Programming</b>	$\begin{aligned} \max \quad & x_1 - 3x_2 \\ \text{s.t.} \quad & x_1 > x_2 \\ & x_1, x_2 \in \mathbb{Z} \end{aligned}$	Variable assignments	Neural Diving (Nair et al, 2020)
<b>Travelling salesman</b>		Shortest routes	Attention Model (Kool et al, 2018)

# Supervised learning for combinatorial problems

<b>Travelling salesman</b>		Shortest routes	Attention Model (Kool et al, 2018)

## Limitation:

- Combinatorial optimization is NP-hard
- Worst-case exponential complexity
- Labelling = Not scaling

# Self-supervised pre-training for image and vision

- Language: BERT (Kenton et al, 2019)
- Vision: CLIP (Radford et al, 2021)

**BERT's Performance - SWAG (Situations With Adversarial Generations)**

System	Dev	Test
BERT <sub>LARGE</sub>	86.6	86.3
Human (expert)	-	85.0
OpenAI GPT	-	78
ESIM+GloVe	51.9	52.7
ESIM+ELMo	59.1	59.2

- ✓ Better sample efficiency in downstream tasks
- ✓ Better multi-task performance
- ✓ Better transfer performance
- ✓ Better robustness
- ✓ .....

# SimCLR: contrastive learning for image representations

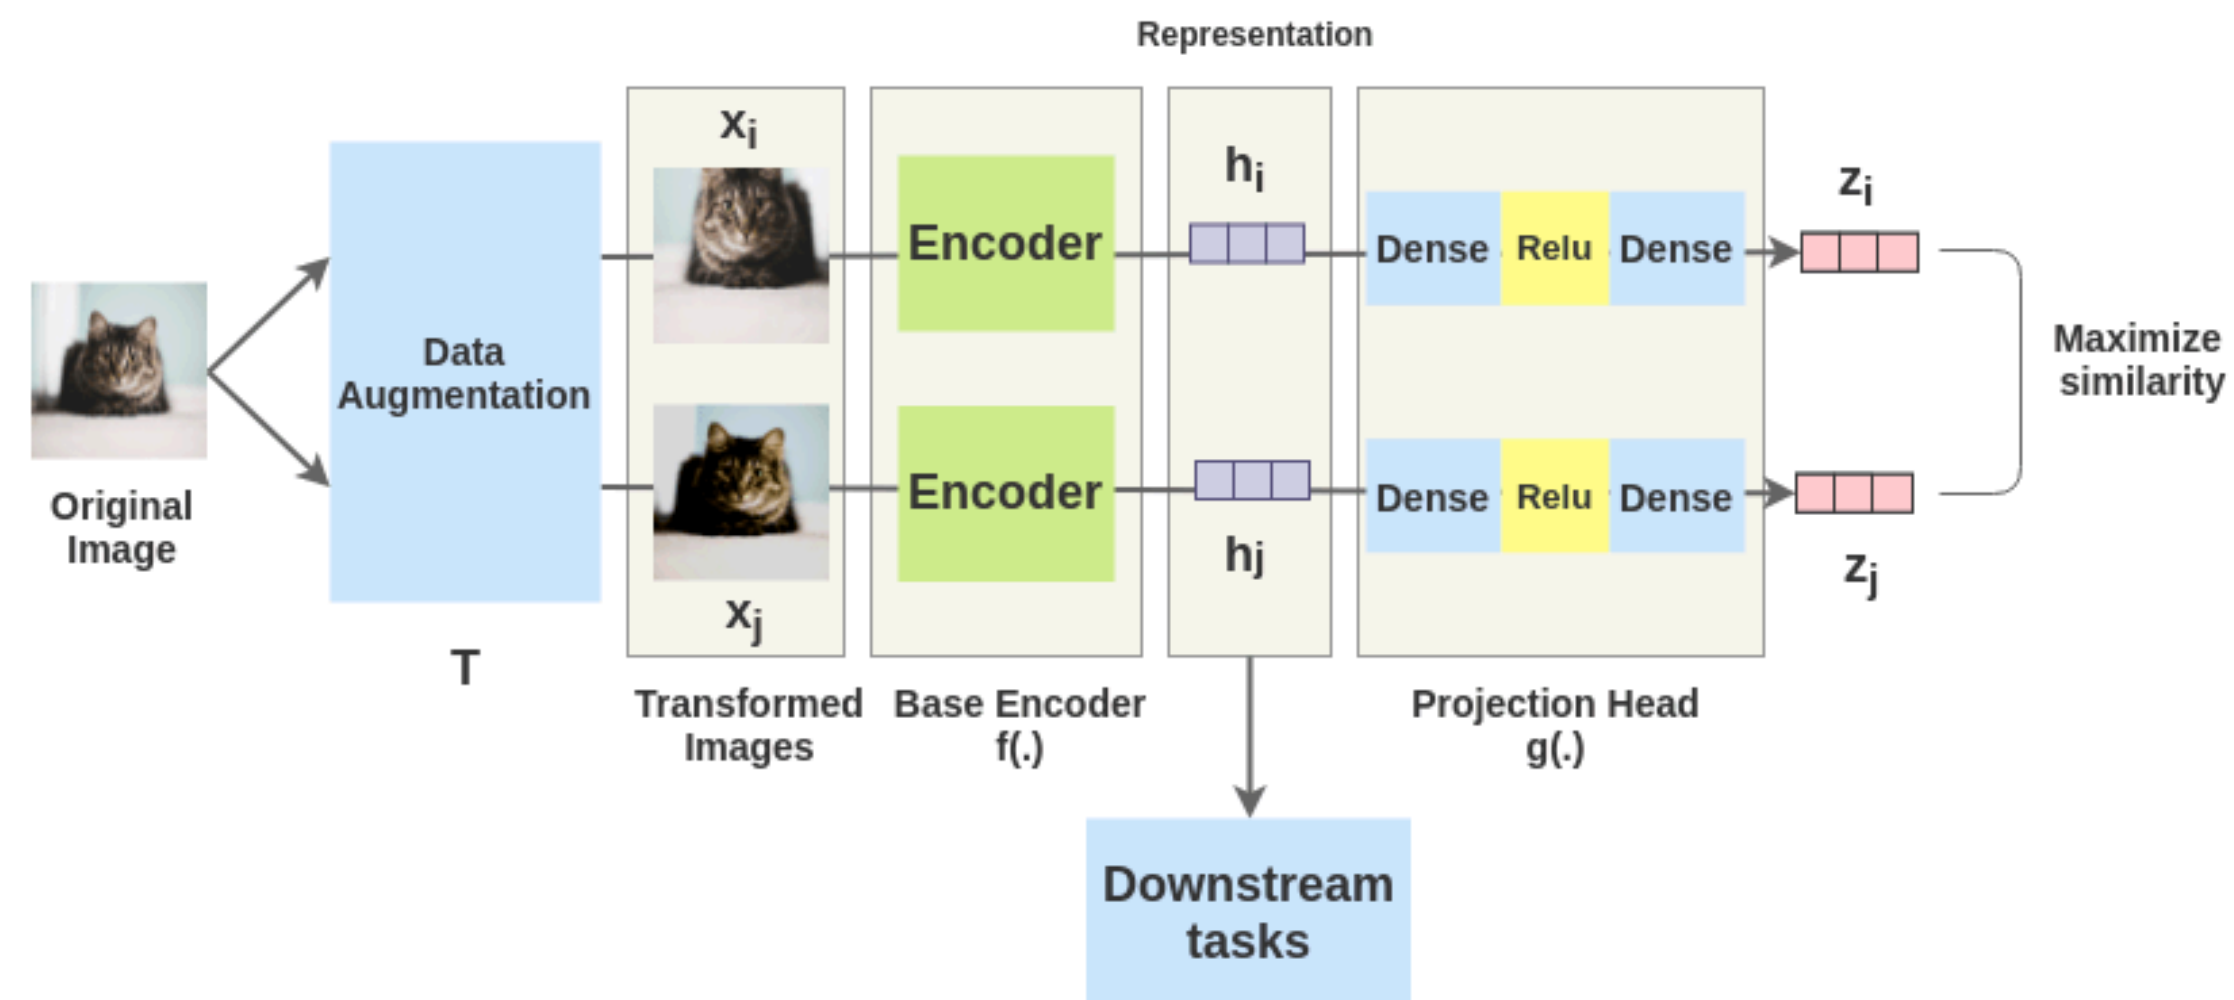

Maximize the agreement between different augmented views of the same data

# SimCLR: contrastive learning for image representations

Outperforming AlexNet on ImageNet using only **1%** of the labels

# SimCLR: contrastive learning for image representations

Outperforming AlexNet on ImageNet using only **1%** of the labels

## SimCLR for SAT representations?

# How to design augmentations? - Image

(a) Original

(b) Crop and resize

(c) Crop, resize (and flip)

(d) Color distort. (drop)

(e) Color distort. (jitter)

(f) Rotate  $\{90^\circ, 180^\circ, 270^\circ\}$

(g) Cutout

(h) Gaussian noise

(i) Gaussian blur

(j) Sobel filtering

# How to design augmentations? - SAT

- Requirements: the augmentations should
  - **preserve labels (satisfiability):**  $SAT \Rightarrow SAT$ ,  $UNSAT \Rightarrow UNSAT$
  - **efficient to compute**

# How to design augmentations? - SAT

- Requirements: the augmentations should
  - preserve labels (satisfiability):  $SAT \Rightarrow SAT$ ,  $UNSAT \Rightarrow UNSAT$
  - efficient to compute
- The algorithms used in preprocessing components of SAT solvers are the perfect candidate.

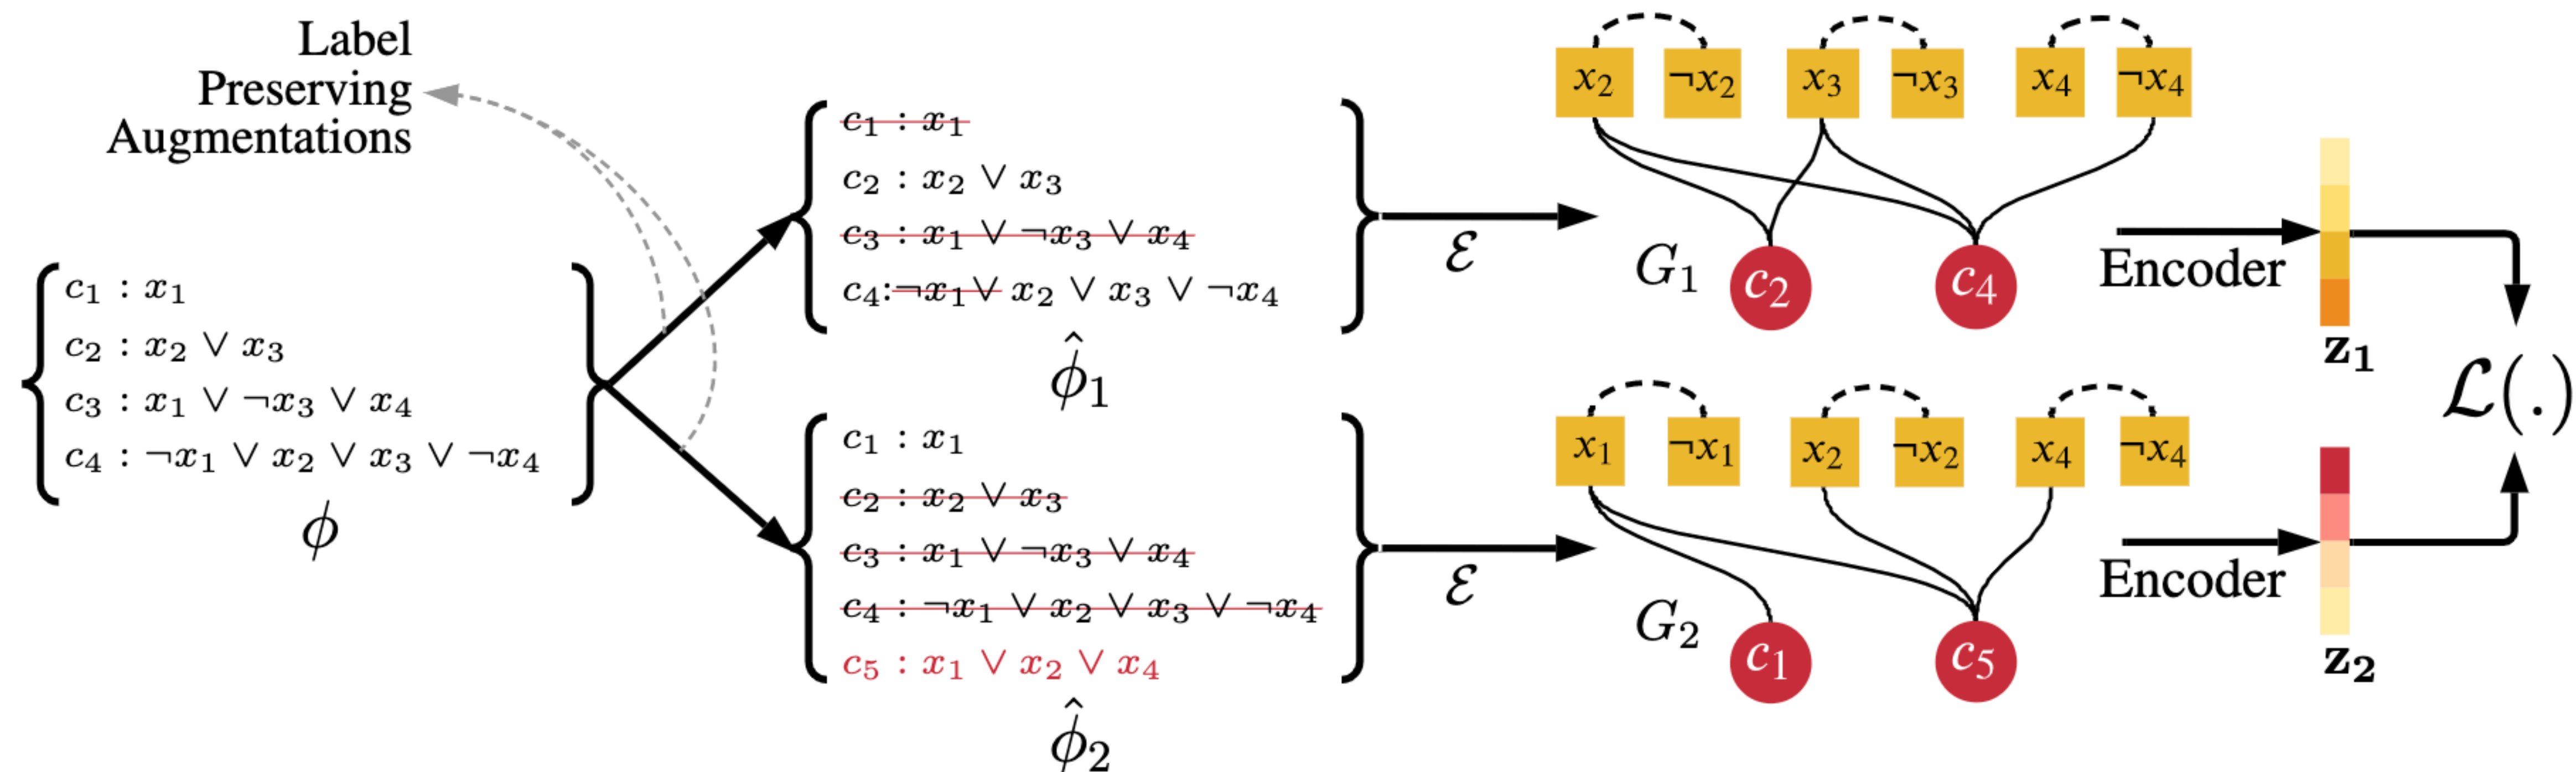

# Label-preserving augmentations (LPAs)

- Unit propagation (UP)
- Clause resolution (CR)
- Variable elimination (VE)
- Subsumed clause elimination (SC)
- .....
