Creative Machine Learning

- ▶ When the environment does not provide us with rewards we must generate our own **intrinsic** rewards<sup>1</sup>
- ▶ Curiosity driven learning<sup>1</sup> uses **surprise** as intrinsic rewards

- ▶ Things are often **impossible** to predict that doesn't mean they are meaningfully surprising...<sup>2</sup>
- ▶ These are **"Stochastic Traps"** - Shyam et al.<sup>3</sup> or 'Noisy TVs'  
- Schmidhuber et al.<sup>4</sup>

- ▶ Our intrinsic reward computation reduces surprise when there is high **aleatoric uncertainty**<sup>5</sup>
- ▶  $s$  and  $a$  are states and actions,  $f$  and  $g$  are prediction networks for the mean and aleatoric variance of the next state

Example CIFAR images tiled across game screen

# Play Retro Games or watch CIFAR-10 images?

- ▶ AMAs can avoid **Noisy TVs** in curiosity driven learning
- ▶ We tested on artificial noisy TVs and isolated a natural noisy TV in Bank Heist
- ▶ This suggests a possible role for acetylcholine coding for **“expected” aleatoric uncertainties**<sup>7</sup>—future neuroscience research should compare the AMA model with **biological data**
- ▶ Future RL research should integrate AMA further into state of the art exploration algorithms and investigate how frequently Noisy TVs appear in real world applications
