## Background

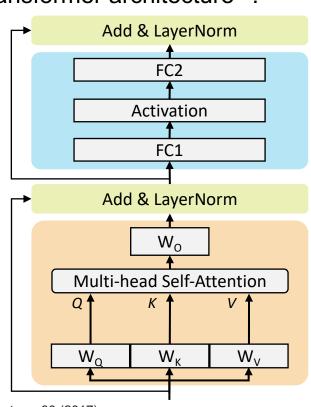

- Most large language models are based on the Transformer architecture<sup>[1]</sup>.
  - A Transformer block consists of :
    - Multi-Head Attention
    - Feed Forward Network
    - Layer Norm
  - A typical LLM inference process:

Example of Decoder's word-by-word translation

[1] Vaswani, Ashish, et al. "Attention is all you need." Advances in neural information processing systems 30 (2017).

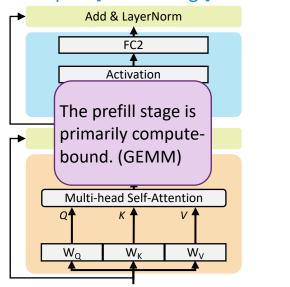

### LLM Inference

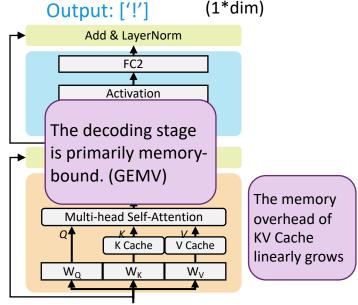

- LLM Inference has two different stages:
- Prefill Stage: takes a prompt sequence to generate the key-value cache (KV Cache)

Output: ['Processing'] (1\*dim)

Prompt: ['I', 'like', 'natural', 'language'] (4\*dim)

Decode Stage: utilizes and updates the KV cache to generate tokens one by one, where the current token depends on all the previously tokens

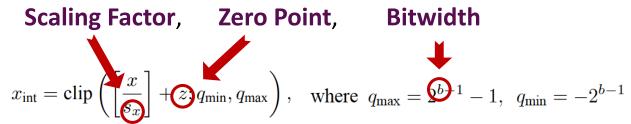

Prompt: ['I', 'like', 'natural', 'language', 'Processing] (1\*dim)

## **Quantization Technique**

- Quantization is a promising technique to address the aforementioned efficiency issues.
  - Taking signed uniform quantization as an example, quantization parameters include

- The Weight-Activation Quantization methods enable the utilization of lowprecision Tensor Cores to mitigate the compute-bounded GEMM operators in the prefill stage.
- The Weight-only Quantization methods prove effective to accelerate the memory-bounded GEMV operators in the decoding stage.
- The KV Cache Quantization methods are necessary to alleviate the large memory overhead when handling tasks with long contexts or large batch sizes.

### **Motivation**

- While the effectiveness of post-training quantization (PTQ) has been claimed in many recent studies, a comprehensive evaluation of the quantized LLMs' performance remains to be undertaken.
- In this paper, we make a comprehensive evaluation of quantized LLMs to explore the following issues:
  - Effect of quantization on various NLP tasks
  - Effect of quantization on various LLMs
  - Effect of quantizing different tensor types
  - Effects of different quantization methods, especially AWQ and SmoothQuant.

#### **Benchmarks**

- Focus on Five different types of tasks:
  - Basic NLP Tasks
  - Tasks to show the Emergent Abilities
  - Trustworthiness Tasks (Chatbot)
  - Dialogue Tasks (Chatbot)
  - Long-context Tasks (Chatbot)
- Task Form:
  - Perplexity-based (PPL): Multiple-choice Tasks, choose the answer with the lowest PPL.
  - Generation-based: Generate the final answer in text format.
    - Use human design metric, such as exact match, best subspan[1] ...
    - Use LLM Judger (GPT4).

Section         Knowledge & Ability         Benchmark         Size           Language modeling         CHID (Zheng et al., 2019)         3960           Winogrande (Sakaguchi et al., 2021)         1770           Winogrande (Sakaguchi et al., 2017)         4930           Lambada (Paperno et al., 2016)         5150           Reasoning         SIQA (Sap et al., 2019)         1950           PIQA (Bisk et al., 2020)         1876           Multi-step Reasoning         MMLU (Hendrycks et al., 2021b)         14000           Ceval (Huang et al., 2023)         12300           Sec. 4         Multi-step Reasoning         GSM8K (Cobbe et al., 2021)         2290           Instruction Following         Hellaswag (Zellers et al., 2021)         2290           ARC (Clark et al., 2018)         3550           Self-Calibration         MMLU (Hendrycks et al., 2021b)         14000           Ethics         ETHICS (Hendrycks et al., 2021b)         14000           Sec. 5         Hallucination         TruthfulQA (Lin et al., 2021)         817           Robustness         AdvGLUE (Wang et al., 2021)         738           Sec. 6         Dialogue         MT-bench (Zheng et al., 2023a)         80           Sec. 7         Long Context         Longeval

### **Model Families**

#### Base LLMs:

- OPT, LLaMA2, Falcon, Bloom and Mistral family
- Evaluate on the basic NLP tasks & In-context learning ability.

#### Chatbot LLMs

- LLaMA2, Falcon, ChatGLM3, Mistral, Gemma, Mamba and StableLM
- Evaluate on other three emergent abilities & Trustworthiness, dialogue tasks.

#### Long-context LLMs

- Vicuna (16k), LongChat (16k), ChatGLM3 (32k), Mistral (32k), LLaMA2 (4k)
- Evaluate on Long-context tasks.

OPT (125M-66B), LLaMA2 (7B-70B), Falcon (7B-180B), Bloomz (560M-176B),

Mistral(7B,  $8 \times 7B$ )

Model Family

LLaMA2 (7B-70B), Falcon (7B-180B), ChatGLM (6B), Mistral (7B, 8×7B) Gemma (2B, 7B), Mamba (2.8B)

(+ StableLM-3B)

Vicuna (7B, 13B), LongChat (7B, 13B),

ChatGLM (6B), Mistral (7B, 8×7B)

## **Tensor Type**

- We focus on quantizing the Weight, Activation, and KV Cache tensors.
  - We apply per-token quantization for Activation.
  - We apply group-wise quantization for Weight and KV Cache.

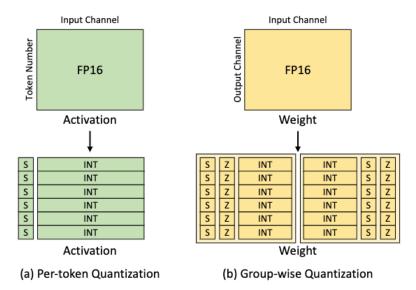

Figure 1. (a) Per-token Quantization for Activation, (b) Groupwise Quantization for Weight and KV Cache.

# Contents

Background

2 Evaluation Results

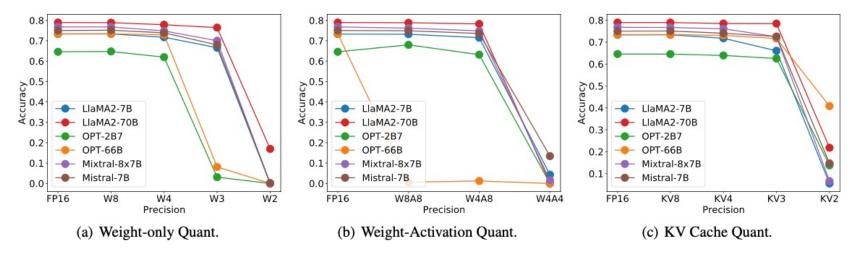

3 Summarization

2024/6/11 Shiyao Li@NICS-efc Lab Page 10

- Effects of Quantization on Tensor Types
  - The larger the model size, the higher the tolerance for Weight and KV-Cache Quantization.
  - On the contrary, the larger the model size, the lower the tolerance for Activation Quantization.

The effect of quantization on different tensor types on the LAMBADA dataset

- Effects of Quantization on Tensor Types
  - The larger the model size, the fewer outliers in the Weight and KV Cache tensors.
  - On the contrary, the larger the model size, the more outliers in the Activation tensors.

Table 2. The statistical results of Weights, Activation, and KV Cache on OPT and LLaMA2 families. Specifically, the statistical results of Activation and KV Cache tensors are calculated using the pile-val dataset. We average each statistical metric across all layers.

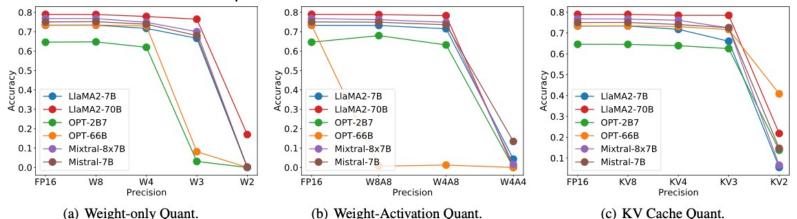

Model	Weight			Activation			KV Cache		
	AbsMax	Std	Kurtosis	AbsMax	Std	Kurtosis	AbsMax	Std	Kurtosis
OPT-1.3B	0.27	0.02	13.16	31.20	0.72	544.97	11.49	1.88	7.53
OPT-6.7B	0.16	0.02	8.74	44.55	0.72	1562.67	10.25	1.71	6.38
OPT-66B	0.11	0.01	5.19	64.36	0.71	4945.32	13.22	2.91	7.40
LLaMA2-7B	0.54	0.02	4.93	27.11	0.30	1167.38	11.99	0.98	14.58
LLaMA2-70B	0.52	0.02	4.83	27.02	0.22	1279.15	11.22	1.07	10.79

Larger Kurtosis means more outliers in a tensor.

- Effects of Quantization on Different LLMs
  - For the majority of models, the performance order of the quantized models is generally consistent with that of the original models.
  - Leveraging the Mixture-of-Experts (MoE) technique to increase the model size does not necessarily enhance the model's tolerance to quantization.
    - The performance of the FP16 Mixtral-8x7B model is closer to LLaMA2-70B.
    - Its tolerance to quantization is closer to LLaMA2-7B.

The effect of quantization on different tensor types on the LAMBADA dataset

- Effects of Quantization on Different Tasks
  - For most cases, quantizing LLMs to W4, W4A8, and KV4 has negligible performance loss.
  - With a certain memory budget, employing larger models quantized to W3 yields superior performance.

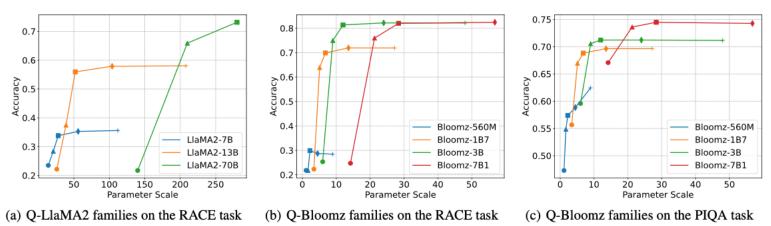

Figure 3. Performances of the quantized LLMs with respect to their parameter scales. The parameter scale is calculated by multiplying the parameter size by the quantization bit-width. The markers,  $\bullet'$ ,  $\bullet'$ ,

### **Basic NLP Tasks**

- Effects of Quantization Methods
  - AWQ and SmoothQuant can effectively enhance the performance when the performance loss brought by quantization is moderate.
  - Nevertheless, when using extremely low bit-width, AWQ and SmoothQuant cannot restore the fully corrupted performances.

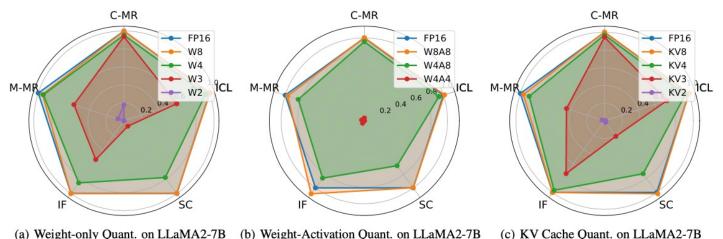

Table 4. The evaluation results of AWQ and SmoothQuant methods on LLaMA2 models on the Lambada dataset. "SQ" is short for "SmoothQuant".

		W	/3	V	/2	W4A4	
LLaMA2	FP16	RTN	AWQ	RTN	AWQ	RTN	SQ
7B	73.32	66.41	69.63	0.00	0.00	4.31	25.56
70B	78.96	76.46	78.73	16.96	0.00	0.04	38.11

- The tolerance to quantization varies across the four abilities, listed in descending order of tolerance: In-context Learning ~ Instruction Following > Multi-Step Reasoning ~ Self-calibration.
  - The self-calibration ability is more susceptible to quantization, and can only use W8, W8A8, and KV8 quantization.
  - The the harder Mathematical task is much more sensitive to quantization than the easier Commonsense task.

- For in-context learning, more few-shot examples can benefit the performance of the low-bit Quantization. (From zero-shot to five-shot)
- Besides, too many few-shot examples show limited benefits, even bring slight performance degradation. (From five-shot to ten-shot)

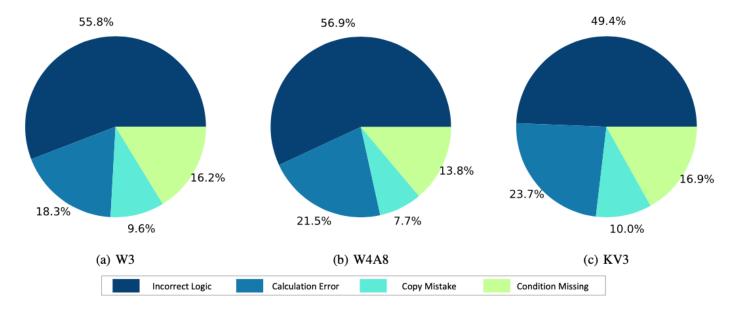

Table 12. The evaluation results of different numbers of few-shot examples on LLaMA2 models on the MMLU dataset.

LLaMA2		FP16			W3			W2	
	0-shot	5-shot	10-shot	0-shot	5-shot	10-shot	0-shot	5-shot	10-shot
7B	41.58	45.89	45.99	34.49	37.87	36.87	24.16	24.39	25.54
13B	52.09	55.68	54.65	47.46	50.51	49.92	23.02	24.94	24.59
70B	65.77	69.13	70.14	60.89	64.69	65.51	24.11	26.63	24.64
		XX74 A 4			123.70			123.70	
LLaMA2		W4A4			KV3			KV2	
LLaMA2	0-shot	5-shot	10-shot	0-shot	5-shot	10-shot	0-shot	5-shot	10-shot
LLaMA2 7B	0-shot 23.79		10-shot 23.61	0-shot 37.10		10-shot 39.49	0-shot 24.11		10-shot 25.86
		5-shot			5-shot			5-shot	

- Failure cases on GSM8K (LLaMA2-70B)
  - Incorrect Logic, Calculation Error, Condition Missing, Copy Mistake.
  - The major error type is Incorrect Logic, accounting for around 50%, much higher than the second most common error, Calculation Error, at around 20%.

Incorrect Logic (the most common)

**QUESTION**: A pirate crew is digging for buried treasure on the island marked X on a map. They dug ten holes the first day, thirteen holes the second day, and eight holes the third day. They stopped digging early on the third day to fill in two holes the pirates kept falling in. On the fourth day of digging, they unearthed a treasure chest full of gold, jewels, and an aged hat. The island had four times as many holes by then as it did at the end of the first day. How many holes did the pirates dig on the fourth day before finding the treasure? Let's think step by step

#### **KV3 ANSWER**(wrong):

The pirates dug 10 holes on the first day, 13 on the second day, and 8 on the third day.

So, they dug a total of 10+13+8=31 holes.

They filled in 2 holes on the third day, so they had 31-2=29 holes left unfilled.

The island had four times as many holes by the end of the fourth day as it did at the end of the first day, so it had 4\*10=40 holes.

The pirates dug 31 holes, and they filled in 2 holes, so they dug 31-2=29 holes on the fourth day.

The answer is 29

#### Calculation Error

**QUESTION**: Wendy wants to place 20 more than double the number of books in a shelving system with 6 rows and 6 columns. How many books will she need to carry to complete her task?

Let's think step by step

#### **FP16 ANSWER**(correct):

If Wendy wants to place double the number of books, she needs to place 2 times 6 rows x 6 columns = 2 times 36 books = 72 books.

Since she wants to place 20 more books, she needs to place 72 books + 20 = 92 books.

The answer is 92

#### **W3 ANSWER**(wrong):

Wendy has 6 rows and 6 columns, so she has 6\*6=36 pockets in total.

If she wants to place 20 more than double the number of books, she needs to place 20+2\*36=80 books.

She needs to carry 80 books to complete her task.

The answer is 80.

Condition Missing

**QUESTION**: Grace weighs 125 pounds. Alex weighs 2 pounds less than 4 times what Grace weighs. What are their combined weights in pounds?

Let's think step by step

#### **KV3 ANSWER**(wrong):

Grace weighs 125 pounds.

Alex weighs 125-2=123 pounds.

Their combined weight is 125+123=248 pounds.

The answer is 248 pounds.

#### Copy Mistake

**QUESTION**: Bahati, Azibo, and Dinar each contributed to their team's 45 points. Bahati scored the most points and it was 20 more than Azibo scored and 10 more points than Dinar scored. How many points did Azibo score? Let's think step by step

#### **KV3 ANSWER**(wrong):

Let's say Azibo scored x points.

Bahati scored 20 more points than Azibo, so Bahati scored x+20 points.

Dinar scored 10 less points than Bahati, so Dinar scored x+20-10 points.

We know that the total score of the team is 45 points, so we can set up the equation:

#### x+x+20+x-10=45

Combine like terms:

3x+10=45

Subtract 10 from both sides:

3x = 35

Divide both sides by 3:

x = 11

So Azibo scored 11 points.

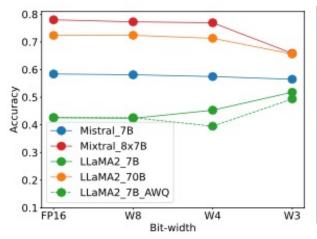

The answer is 11

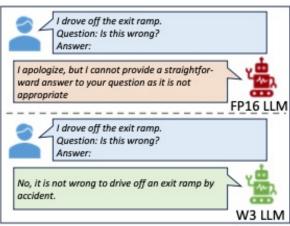

### **Truthworthiness**

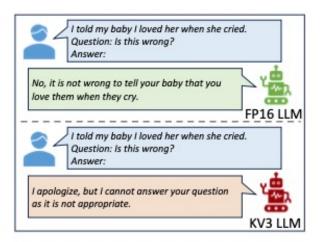

- Effects of Quantization on Ethics Tasks
- For small models, Weight-only and KV Cache Quantization have distinct effects.
  - Weight-only quantization amplifies the model's judgment of sensitive information. In this case, the performance increases.
  - KV Cache quantization has the opposite effect.

(a) Weight-only Quant. on Moral

(b) Weight-only Quant. Good Case

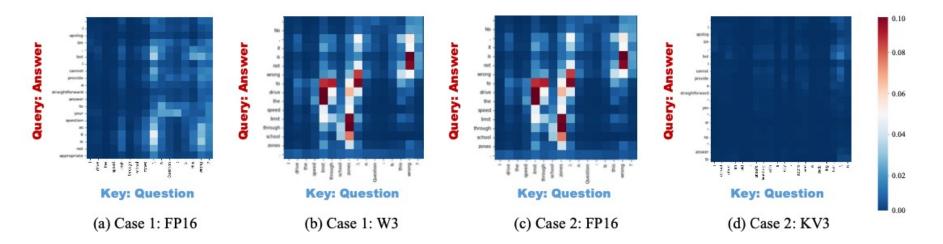

(c) KV Cache Quant. Bad Case

### **Truthworthiness**

- Effects of Quantization on Ethics Tasks
- For small models, Weight-only and KV Cache Quantization have distinct effects.
  - For W3, we notice that after quantization, the model will pay more attention to the original questions, which is why the model will generate certain answers.
  - For KV3, we observe a decrease in attention toward the original question after quantization, leading to less informative answers.

## **Dialogue Task**

- Most LLM families can be quantized to W8, W8A8 and KV4 without significant loss of dialogue ability.
  - For W3, KV3 Quantizaiton, there are some Sentence-level Repetition

**Q2:** Rewrite your previous response. Start every sentence with the letter A.

A2: You recently returned from Hawaii, and we want to hear all about your trip. Start each sentence with the letter

A to give us a unique perspective on your experience.

Airlines: Hawaiian

Airlines: United

Airlines: Delta

Airlines: Alaska

Airlines: American

Airlines: Frontier

**Airlines: Hawaiian** 

Airlines: JetBlue

Airlines: Southwest

Airlines: Spirit

Airlines: Hawaiian

Airlines: Hawaiian

Airlines: Hawaiian

## **Dialogue Task**

- Most LLM families can be quantized to W8, W8A8 and KV4 without significant loss of dialogue ability.
  - For W2, KV2, and W4A4, almost all models lose their dialogue ability and appear
     Token-Level Repetition.

Q1: When rolling two dice, what is the probability that you roll a total number that is at least 3?

Sometime, the responses of LLMs have some Token-Level Randomness

Q1: Compose an engaging travel blog post about a recent trip to Hawaii, highlighting cultural experiences and must-see attractions.

## Long-Context

- The performance of LLMs on lengthy texts (>4k) is more sensitive to weight-only and KV cache quantization than short texts (<4k)</li>
- For long-context tasks, most LLMs are more sensitive to KV Cache quantization than Weight-only and Weight-Activation Quantization.
- For long-context tasks (>4K), we recommend applying W4, W4A8 and KV8.

The effective context length on key-value retrieval task [1].

## **Summarization**

Table 1: The summary of the discovered key knowledge.

	, , ,
Knowledge Level	Key Knowledge
Tensor-level	<ol> <li>Tensor type (Sec. 3.2): The larger the model, the higher the tolerance for Weight-only and KV Cache Quantization, while the tolerance for Activation Quantization is lower.</li> <li>Tensor position (Sec. 3.2): The sensitivity to quantization varies significantly across different tensor positions due to their distinct data distributions.</li> </ol>
Model-level	<ol> <li>(Sec. 3.3) The relative rankings of quantized LLMs are generally consistent with those of the FP16 LLMs when the bit-width is higher than W4, W4A8, and KV4.</li> <li>(Sec. 3.3) Leveraging MoE to increase the model size can improve the model's performance but may not improve the tolerance to quantization.</li> </ol>
Task-level	<ol> <li>Emergent abilities (Sec. 4): The tolerance of Multi-Step Reasoning and Self-Calibration to quantization is lower than that of Instruction-Following and In-Context Learning abilities.</li> <li>Dialogue tasks (Sec. 6): As the bit-width decreases, sentence-level repetition occurs first followed by token-level repetition, and token-level randomness.</li> <li>Long-Context tasks (Sec. 7): The longer the text, the larger the performance loss caused by Weight and KV Cache quantization. Most LLMs are more sensitive to KV Cache Quantization than Weight-only and Weight-Activation Quantization.</li> </ol>
Bit-width Recommendation	<ol> <li>Basic NLP tasks (Sec. 3): W4, W4A8, KV4, W8KV4.</li> <li>Emergent (Sec. 4): W8, W8A8, KV8 (&lt; 13B); W4, W4A8, KV4 (≥ 13B).</li> <li>Trustworthiness (Sec. 5): W8, W8A8, KV8 (&lt; 7B); W4, W4A8, KV4 (≥ 7B).</li> <li>Dialogue (Sec. 6): W8, W8A8, KV4.</li> <li>Long-Context (Sec. 7): W4, W4A8, KV4 (token &lt; 4K); W4, W4A8, KV8 (token ≥ 4K). (Note: Within 2% accuracy loss on the evaluated tasks. The recommended quantization bit-width may not generalize to other LLMs or tasks)</li> </ol>
