## Introduction and TLDR

- LLMs exhibit profound capabilities due to their scale in terms of both size and training data.

- What happens if you scale speech recognition models to that level?

- We train Whisper-style models on 180K hours of data from 250M to 18B parameters to find out.

- We also experiment with scaling training data from 11K to 360K hours, when model size is fixed at 1B parameters.

- ASR gets predictably better as model size increases. Improves low-resource WER without degrading high-resource.

- ST BLEU can nearly double from 250M to 18B parameters!

- Scaling training data is less conclusive; diversity matters more than sheer quantity.

- Larger models exhibit interesting zero-shot abilities, such as in-context learning and orthographic understanding.

## Scaling from 250M to 18B Parameters

- ST performance improves from < 10 on 15 languages to > 10 on 17 languages

- ASR WER can be directly modeled with a power law function

- Substantial improvements from 2B parameters to 18B parameters! Current models may be too small.

## Scaling Data and Compute

- Left figure shows the effect of increasing from 11K hours of mostly read speech to 360K hours of read + conversational speech.

- General performance doesn't really improve if you keep adding in data from the same domain.

- Right figure compares training TFLOPS with WER. Models around 1-2B parameters are more compute optimal.

## Zero-shot Behaviors and Emergent Abilities

### Orthographic Understanding

| Orthography       | Example     |
|-------------------|-------------|
| Romanization (zh) | shì shī shì |
| Simp. Chinese     | 室诗士         |
| Trad. Chinese     | 室詩士         |
| Romanization (jp) | hashi       |
| Hiragana          | はし          |
| Katakana          | ハシ          |
| Kanji             | 橋           |

- Larger models can be better at choosing what writing system to use. Left shows Chinese, right is Japanese.
- We calculate CER at the character level and phone level. Phone level performance stagnates, but character-level improves!

### In-Context Learning

| Params. | $k=0$ | $k=1$ | $k=2$       | $k=3$       |
|---------|-------|-------|-------------|-------------|
| 0.25B   | 36.9  | 35.1  | <u>33.7</u> | 34.5        |
| 0.50B   | 53.3  | 39.2  | <u>33.8</u> | 33.9        |
| 1B      | 41.8  | 35.0  | <u>31.6</u> | 31.8        |
| 2B      | 47.3  | 35.1  | <u>31.9</u> | 33.2        |
| 4B      | 40.4  | 32.4  | <u>31.2</u> | 31.8        |
| 9B      | 38.3  | 31.3  | 28.1        | <u>27.4</u> |
| 18B     | 41.3  | 32.7  | 31.3        | <u>28.1</u> |

- We teach the model to perform ASR on Quechua using ICL.
- Concatenate prompt audio and text along time dim.
- Larger models are better at using more context!

### Semantic Mishearing

| Params. | PPL        | MOS        |
|---------|------------|------------|
| 0.25B   | 1338       | 1.9        |
| 0.50B   | 728        | 4.1        |
| 1B      | 559        | 3.5        |
| 2B      | 491        | 3.6        |
| 4B      | 436        | 3.8        |
| 9B      | <b>372</b> | <b>4.8</b> |
| 18B     | 429        | 4.4        |

| Original | Alle burgers van die Vatikaan Stad is Rooms Katoliek. |
|----------|-------------------------------------------------------|
| 0.25B    | Alabarkers fan diva                                   |
| 0.5B     | Alabama cares for the development of the reservation. |
| 1B       | allebergers van the valley                            |
| 2B       | Alabama kerrs fan the game.                           |
| 4B       | Alabama, Cars, Fan, Diva.                             |
| 9B       | All the birds catch the worm.                         |
| 18B      | All the workers found the vat.                        |

- Humans can mishear audio into semantically informative sentences. "Bon Appetit vs Bone Apple Tea"
- Larger models are more likely to do the same, while smaller models are more phonetic.
