

World Model Implanting for Test-time Adaptation of Embodied Agents

Minjong Yoo • Jinwoo Jang • Sihyung Yoon • Honguk Woo*

Contributions

- We present the novel WorMI framework to enable crossdomain embodied policy adaptation at test-time, exploring the dual-stage model compositionality: world-to-world knowledge integration and world-to-reasoning alignment.
- This dual-stage design not only combines the strengths of model integration (which embeds a domain-specific model as part of the policy) and in-context adaptation (which incorporates examples relevant to target domains) but also significantly enhances adaptability to unseen domains.

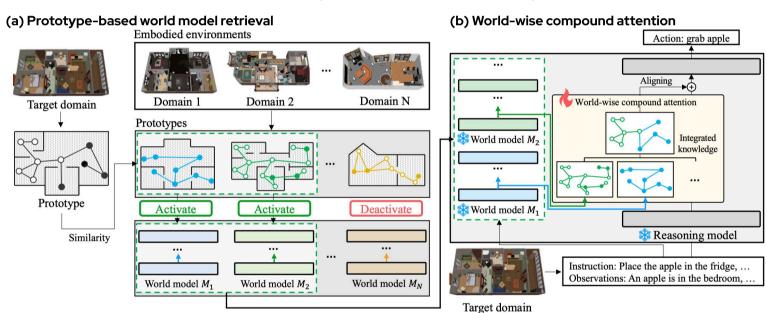

Bedroom Livingroom Kitchen Open cabinet Put folder on sofa Place breadslice in microwave

 WorMl dynamically shifts its focus among the three world models as the target domain varies along with different tasks, assigning higher attention weights to the model most relevant to the current task.

Our Approach

WorMI Framework

- (a) Prototype-based world model retrieval: Retrieves and integrates only the most relevant world models for the current target domain
- **(b) World-wise compound attention:** Integrates the intermediate representations of multiple world models and then align them with the reasoning model

World-wise Compound Attention

- Linear Projection: matching its dimension to that of the reasoning model's embedding space
- World-level Cross-attention: quantifying the relative importance of each world model's representation, conditioned on the current hidden state of the reasoning model.
- Reasoning-level Cross-attention: after obtaining the integrated representation of world models via the world-level crossattention, we align it to the reasoning model.

World model M_1 World-wise compound attention C_{θ} Reasoning-level cross-attention $Attn_{\theta}^{R}$ World model M_2 World-level cross-attention $Attn_{\theta}^{W}$ World model M_K Unique projection L_{θ} Linear projection L_{θ} Linear projection L_{θ} L_{m_K}

Evaluations

• Evaluated in VirtualHome and ALFRED environments.

VirtualHome

- Cross-domain environment: Various room layouts (Scenes) and tasks types (Tasks)
- **Performance metric: SR** is the Success Rate, and **PS** is the Pending Steps.

- We evaluate the embodied task planning performance, wherein each policy is evaluated in a zero-shot and few-shot manner.
- WorMI outperforms LLM-based baselines with 16.2% higher SR and 3.77 lower PS in a zero-shot, and 22.87% higher SR and 6.17 lower PS in a few-shot manner.
